## Introduction

This 1997 revision of what is popularly called "the DIS enumeration document" has been prepared by the Institute for Simulation and Training (IST). The original contents of this document began as a set of separate appendices to the early versions of the Standard for Distributed Interactive Simulation (DIS) Protocol Data Units (PDUs). These appendices were eventually bound together under common cover with a single title and published as IST-CR-93-19. Stewardship of this document was then temporarily transferred to the Joint Interoperability Engineering Organization (JIEO), which substantially increased the level and amount of detail. The next revision by IST, published as IST-CR-93-46, retained the many substantive contributions of JIEO, while restructuring the document for the first time as the single, integrated source for all enumeration fields found in the DIS PDUs. At this time a changes control process was initiated for all changes to this document.

#### 4.2.3 Comprehensive Entity-Type tables

The following tables list the correct field values of the Entity-Type record for many specific entities in a typical DIS exercise. The header on each page contains the Kind-, Domain-, and Country-field values for all entities on that page, as specified in 4.2.1. The remaining field values (Category, Subcategory, Specific) are nested in numerical order (with occasional exceptions due to correction or update) with specific definitions appropriate to the entity's kind, domain, and country. The value of zero used in a category, subcategory, or specific field in this enumerations in this section and associated subsections shall mean "other" in all cases whether explicitly stated or not. Any unused field shall be 0-filled.

#### 4.7.3.1 Example #1

To represent the articulation of a tank gun, azimuth of the turret is required as well as the elevation of the gun. This represents two articulated parts. The turret is attached to the tank. It has ID - Part Attached to = 0 because it is attached directly to the tank. We wish to dead reckon the position of the turret, so we require two articulation parameters for the turret: the azimuth and the azimuth rate. Azimuth will be articulation parameter #1 and azimuth rate will be articulation parameter #2. The gun is attached to the turret. It has ID - Part Attached to = 1 because it is attached to the turret. The gun has one articulation parameter, namely the elevation of the gun. Elevation will be articulation parameter #3.

For the turret, parameter #1 is the azimuth. The value to represent this is 4107: 4096 (primary turret) + 11 (azimuth of that turret). Parameter #2 is the azimuth rate. The value to represent this is 4108: 4096 + 12 (azimuth rate). For the gun, parameter #1 is elevation. The value to represent this is 4429: 4416 (primary gun) + 13 (elevation).

Suppose the turret is slewed but the elevation is unchanged. Then the three Articulation Parameter records would be:

Change indicator: ID - Part Attached to: Parameter #1 type: Parameter value:	(value increment to indicate a change) 0 (tank) 4107 (an angle in radian)
Change indicator: ID - Part Attached to: Parameter #2 type: Parameter value:	(value increment to indicate a change) 0 (tank) 4108 (rate in radian/sec)
Change indicator: ID - Part Attached to: Parameter #1 type: Parameter value:	(value unchanged to indicate no change) 1 (turret) 4213 (zero)

#### 4.7.3.2 Example #2

To represent an air-to-surface missile on an aircraft it is necessary to specify the station to which the missile is attached and the type of missile. For example, for a missile on the first left-wing station, the parameter type would be 0640. (The Parameter-Value field would indicate the type of munition attached to that station.) The Articulation Parameter record would then appear as:

Change indicator:	(value unchanged to indicate no change)
ID - Part Attached to:	0 (aircraft)
Parameter #1 type:	0640
Parameter value:	(type of missile from 64-bit munition type)

If the missile was fired, the next Entity State PDU would have an Articulation Parameter record with the following information on the launched missile:

Change indicator:	(value increment to indicate a change)
ID - Part Attached to:	0 (aircraft)
Parameter #1 type:	0640
Parameter value:	(type of missile from 64-bit munition type)

The change indicator specifies that the munition that was present is no longer present.

### **8.3 IFF/ATC/NAVAIDS PDU**

The enumerations for the IFF/ATC/NAVAIDS PDU are listed by system type. There are currently no enumerations for System Type = 0 (Other) or for NAVAIDS. Field values in *italics* represent all the other values for a field, in addition to those that apply to the specific system type listed. They are included for some of the fields to facilitate comprehension.

For IFF Mode 1, 2, and 3 code elements, the IFF code is placed in the code elements reading right to left. For example a Mode 2 code of 2376 would be placed in the Parameter 2 code elements as follows: Code element 1 = 6, Code element 2 = 7, Code element 3 = 3 and Code element 4 = 2. The entire 16-bit Code/Status field is then passed as an unsigned integer.

### 8.3.6 Specific Issuance/Receipt Rules

#### 8.3.6.1 Issuance Rules: System Type 1 (Mark X/XII/ATCRBS/Mode S Transponder)

- 1) System ID Record: Alternate Mode 4. Any application that transmits Mode 4 shall always set the Alternate Mode 4 field to the appropriate value in the Fundamental Data Record and shall set the Alternate Mode 4 field in the System ID Record to 1. The application may also send a "pseudo-crypto" value in the Mode 4 parameter if coordinated with other sites prior to the exercise.

2) System ID Record: Alternate Mode 5/C. Any application that transmits Mode 5/C shall always set the Alternate Mode 5/C field to the appropriate value in the Fundamental Data Record and shall set the Alternate Mode 5/C field in the System ID Record to 1. The application may also send the actual Mode 5/C encoded altimeter in the Mode 5/C parameter.

3) Fundamental Operational Data Record: System Status: System On/Off. The System On/Off Status shall be set to 1 if any of the Modes (Parameters 1-6) are set to On. Otherwise the status shall be set to Off. If the Entity State PDU Appearance Damage Status value = 3 (Destroyed) for the associated entity and the entity is not canceled at the time it is destroyed, the System Status/System On/Off field and all Parameter 1-6 Status fields (Bit 13) for Capable modes shall be set to 1 (Off). This change in status shall be automatically set within 10 seconds of the simulation determining that the entity could no longer transmit a reply to an interrogation. For the destroyed case, it is not required that the Operational Status field be set to System Failed or the Parameter 1-6 Damage or Malfunction Status fields be set to 1. However, these fields can be set if desired. At least three periodic updates shall be sent for the IFF/ATC/NAVAIDS PDU following the change to Off status due to the entity being destroyed. After the three periodic updates are sent, a simulation may either continue to send periodic updates or cease sending them.

4) Fundamental Operational Data Record: System Status: Capable Parameters 1-6

Any application that transmits an IFF/ATC/NAVAIDS PDU with System Type =1 shall set the Capable Parameters 1-6 to report which modes are capable and not capable of being transponded by the emitting entity.

5) Fundamental Operational Data Record: Operational Status. This status shall be set to 1 (System failed) if no Parameter 1-6 or Modifier parameter (Emergency, Squawk Flash, STI) can be transponded regardless of the System Status/System On/Off field setting. Otherwise, the status shall be set to 0.

6) Fundamental Operational Data Record: Parameter 1-6 Codes. Codes shall reflect the present code settings for an entity at the time an IFF/ATC/NAVAIDS PDU is transmitted and are independent of the present Mode Status settings. Code 0 shall not be used to indicate off for a mode. However, code zero may be transmitted for a mode if that is the setting for the transponder. Mode 1, 2, and 3 codes represent octal values that are set into the appropriate code elements. Each associated parameter is an unsigned integer that includes both the code and status values. When decoded, the code elements are converted back to the appropriate octal values. If actual Mode 5/C encoded altitude is being transmitted, an IFF/ATC/NAVAIDS PDU shall be transmitted once for each 100-foot change in entity altitude.

7) Fundamental Operational Data Record: Modifier Parameters. When a Modifier parameter is set to on to report truth data not related to a specific interrogation reported in an IFF/ATC/NAVIADS PDU, and the condition is transitory, such as the Squawk Flash, the issuing application shall ensure that an IFF/ATC/NAVAIDS PDU is transmitted with the parameter set to off when the transitory condition has ended. For Squawk Flash, the On state shall be for 30 seconds when not responding to a specific interrogation.

8) Fundamental Operational Data Record: Alternate Mode 4. The Alternate Mode 4 values shall be set to 1, 2 or 3 if the entity is capable of transmitting Mode 4 as reflected in the Capable parameter regardless of whether Actual Mode 4 Pseudo-Crypto is also included in the Parameter 4.

9) System ID Record: Change Indicator. The Change Indicator shall be set to 1 for all initial reports and whenever a change is being reported even if the change coincides with a periodic update report. For all other cases, the Change indicator shall be set to 0.

#### **8.3.6.2 Receipt Rules: System Type 1 (Mark X/XII/ATCRBS/Mode S Transponder)**

- 1) System ID Record: Alternate Mode 4. Any application that can receive Mode 4 data shall be able, as a minimum, to process the Alternate Mode 4 field to derive the present Mode 4 value. If an application can also process any "pseudo-crypto" value contained in the Mode 4 parameter, it may either process the Mode 4 value or the Alternate Mode 4 value. If an application can detect a conflict in the Valid/ Invalid setting between the values in the two fields, the Alternate Mode 4 field value shall be the value that is accepted.
- 2) System ID Record: Alternate Mode 5/C. Any application that can receive Mode 5/C shall be able, as a minimum, to process the Alternate Mode 5/C field in the Fundamental Data Record. If an application can also process an encoded altimeter value contained in the Mode 5/C parameter, it may either process the Mode 5/C value or the Alternate Mode 5/C value (i.e., use the entity's altitude value derived from the Entity State PDU.) If an application can detect a conflict in the values contained in the two fields, the Mode 5/C field value shall be the value that is accepted and not the entity altitude from the Entity State PDU.
- 4) Fundamental Operational Data Record: System Status: Capable Parameters 1-5. If the Not Capable field is set for a specific parameter (1-5), the receiving site/application need not process that Parameter's values in the Fundamental Operational Data Record.
- 5) Fundamental Operational Data Record: Parameter 1-3 Codes. Mode 1, 2 and 3 code values of zero shall be valid and shall not be interpreted as a Mode Off status.
- 6) If a receiving site/application has the capability to set transponder data for received entities for distribution to other applications not directly connected on the DIS network, receipt of transponder data on the received entity shall always override locally entered data for the received entity.
- 7) A receiving site/application may perform validity checks on parameter data to ensure they are within the limits specified in the DIS enumeration document. Only invalid data for the specific parameter processed shall be ignored. Any previously accepted data for that parameter may either be retained or cleared.
- 8) Fundamental Operational Data Record: Mode Status. The Mode Status - Damage and Malfunction field values shall be processed upon receipt as agreed to by participants prior to a DIS exercise.
- 9) Fundamental Operational Data Record: Parameter 6. Mode S data elements shall be agreed to by participants prior to a DIS Exercise.

#### **8.3.6.3 Issuance Rules: System Type 5 (RRB Transponder)**

- 1) Fundamental Operational Data Record: System Status: Capable. All RRB Transponders shall set the Parameter 1 system status bit to 0 (Capable) and the Parameters 2-6 system status bits to 1 (Not Capable).

- 2) Fundamental Operational Data Record: System Status: System On/Off. The System On/Off Status shall be set to 1 (On) if the RRB Response Status (bit 13 in Parameter 1) is set to 1 (On), the RRB Response Damage (bit 14 in Parameter 1) is set to 0 (No Damage) and the RRB Response Malfunction (bit 15 in Parameter 1) is set to 0 (no malfunction). Otherwise the status shall be set to 0 (Off). If the Entity State PDU Appearance Damage Status value = 3 (Destroyed) for the associated entity and the entity is not canceled at the time it is destroyed, the System Status/System On/Off field and the Parameter 1 Status fields (Bit 13) shall be set to 0 (Off). This change in status shall be automatically set within 10 seconds of the simulation determining that the entity could no longer transmit a reply to an interrogation. For the destroyed case, it is not required that the Operational Status field be set to System Failed or the Parameter 1 Damage or Malfunction Status fields be set to 1. However, these fields can be set if desired. At least three periodic updates shall be sent for the IFF/ATC/NAVAIDS PDU following the change to Off status due to the entity being destroyed. After the three periodic updates are sent, a simulation may either continue to send periodic updates or cease sending them.
- 3) Fundamental Operational Data Record: Operational Status. This status shall be set to 1 (System failed) if the RRB Response Damage bit (bit 14 in Parameter 1) is set to 1 (Damaged) or the RRB Response Malfunction bit (bit 15 in Parameter 1) is set to 1 (Malfunction). Otherwise, the status shall be set to 0.
- 4) Fundamental Operational Data Record: Parameter 1 Code. Codes shall reflect the present code settings for an entity at the time an IFF/ATC/NAVAIDS PDU is transmitted and are independent of the present Mode Status settings. Code 0 shall not be used to indicate off for a mode. However, code zero may be transmitted for a mode if that is the setting for the transponder.
- 5) System ID Record: Change Indicator. The Change Indicator shall be set to 1 for all initial reports and whenever a change is being reported even if the change coincides with a periodic update report. For all other cases, the Change indicator shall be set to 0.

#### **8.3.6.4 Receipt Rules: System Type 5 (RRB Transponder)**

- 1) Fundamental Operational Data Record: Parameter 1 Codes. Code values of zero shall be valid and shall not be interpreted as a Mode Off status.
- 2) If a receiving site/application has the capability to set transponder data for received entities for distribution to other applications not directly connected on the DIS network, receipt of transponder data on the received entity shall always override locally entered data for the received entity.
- 3) A receiving site/application may perform validity checks on parameter data to ensure they are within the limits specified in the DIS enumeration document. Only invalid data for the specific parameter processed shall be ignored. Any previously accepted data for that parameter may either be retained or cleared.
- 4) Fundamental Operational Data Record: Mode Status. The Mode Status - Damage and Malfunction field values shall be processed upon receipt as agreed to by participants prior to a DIS exercise.

If any one of these fields is different, except FH Synchronization Time Offset, the hopping pattern is different. Radios on different hopping patterns shall not communicate.
  - a) FH Net ID - This field shall identify the frequency hopping network.

- b) Hop Set ID - This field shall identify the set of frequencies used when creating a hopping pattern. The frequencies in the hop set are transmitted by a method outside the scope of this standard.
  - c) Lockout Set ID - This field shall identify the set of frequencies that are excluded from the hopping pattern. The frequencies in the lockout set are transmitted by a method outside the scope of this standard.
  - d) Transmission Security Key - This field shall identify the transmission security key that is used when generating the hopping pattern. (Not currently implemented, field added for future use).
  - e) FH Synchronization Time Offset - This field shall identify the offset to exercise time in seconds for the clock in the SINCGARS radio. SINCGARS radio clock must be synchronized for the radios to communicate. (Not currently implemented, field added for future use).
2. Start of Message - This field shall specify whether the radio is starting or continuing a transmission. A SINCGARS radio shall not receive any part of an FH transmission if the Start of Message is missed. Start of message may be missed if the radio was transmitting, receiving a different radio or otherwise not ready to start receiving a transmission.
